

APX Application Component

- **APX Transaction:** A transaction is the application unit to be executed in APX Online. It defines the Transactional Unit at the application logic level.
- **APX Library:** Encapsulates the business logic and the access to the data. It publishes its interface so that it can be used by third parties.
- **DTO:** Representation of a Business Entity in the form of a Bean.

The Application provides Architecture utilities that facilitate access to data sources.

Development Strategy: All data access must be encapsulated in a library to facilitate reuse and access control.

APX utilities

The APX Online Architecture is provided with a set of utilities, such as:

- Utilities provided by "special" libraries: These are libraries whose utility can be retrieved by the user from the library itself. These libraries are described in the "Creating libraries" section:
 - Relational database Libraries.
 - Rules Engine Libraries.
 - MongoDB Libraries.
 - Connectors libraries.
 - Interbackend.
 - Document Creator.
 - API Connector.
 - ...
- Common utilities, described in the "Common utilities" section:
 - Errors and Warnings.
 - Trace handling.
 - Input/output information.
 - Header data recovery.
 - ...
